

Studiosity Feedback Process

This term, you will complete your writing project in two steps using [Studiosity](#), an AI-based feedback tool.

1. Submit your draft to Studiosity Writing Feedback+ for feedback.
2. Upload your Studiosity feedback (.pdf) to Quercus by **Sunday, February 16, 11:59:00 PM EST**.
 - *Note:* Submitting only to Studiosity is not sufficient. You must upload the Studiosity output to Quercus.
 - *Date adjustment:* The deadline has been moved to Sunday due to the midterm test.
3. Revise your draft based on the feedback and submit your final version along with a reflection on your edits by **Friday, February 28, 2:00:00 PM EST**.

A detailed grading rubric and instructions for using Studiosity can be found separately on Quercus.

Purposes: Why are we doing this?

This assignment will help you:

- Engage deeply with a psychological topic that interests you.
- Summarize scientific findings in your own words.
- Explore cutting-edge psychology research at the University of Toronto.
- Develop skills in searching for, reading, and citing academic journal articles.
- Think critically about new research questions related to emerging technologies.
- Gain comfort with using artificial intelligence to improve your writing.

Overview

You will complete five steps:

- A. Choose a focused psychological topic from the course textbook.
- B. Summarize in your own words the existing research on the topic.
- C. Identify a related study conducted by a UofT researcher.
- D. Summarize the study in your own words.
- E. Propose an extension of the study using an emerging technology (e.g., AI, wearable devices, virtual reality).

Your final composition must include four sections:

1. **Introduction** – Summary of existing research on your topic.
2. **Study Summary** – Description of a relevant UofT research study.
3. **Research Extension** – Your proposed study using emerging technology.
4. **References** – APA-formatted citations.

Step A: Choosing a Topic

Select a psychological phenomenon from Chapters 7 or 10-16 of the textbook. Choose a specific topic rather than a broad area to make your project more manageable. For example:

- Instead of "psychological disorders," choose "generalized anxiety disorder."
- Instead of "developmental psychology," choose "identity foreclosure."

Step B: Summarizing Existing Research

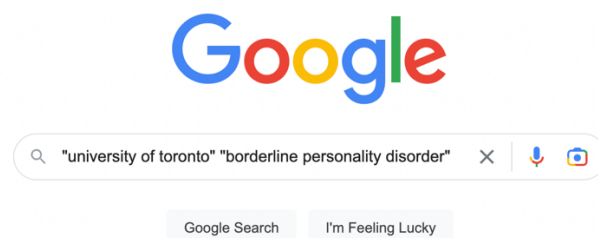

In your own words, summarize what is already known about your topic, citing scholarly sources (textbook and academic articles). Address:

- General findings on the topic.
- How it varies among individuals (e.g., cultural or developmental differences).

This section should be **15-25% of your paper**.

Step C: Finding a UofT Researcher

Identify a UofT-affiliated researcher who has published on your topic. Use Google (e.g., search "University of Toronto" + "[your topic]") or Google Scholar to find relevant studies.

Very often, researchers who study your topic here at UofT will appear on the first page of search results. From there, you can usually find a researcher's webpage, which will tell you more about them, and will usually provide you with a link of their research publications (which you'll need for the next step!).

Note that the University of Toronto has three main campuses and many affiliated hospitals and research institutes. You may choose a researcher from any of these places, as long as they are (or were) somehow affiliated with UofT.

In your paper, provide the researcher's name and UofT affiliation (e.g., "Dr. Kyle Danielson, Department of Psychology, University of Toronto Scarborough").

Step D: Summarizing a Research Study

Find a study published by the UofT researcher that relates to your topic. There are a couple of great ways to find papers that your researcher has written.

- Sometimes researchers put their CVs (academic résumés) on their webpages. These CVs will list all the published papers that the person has written. More recent papers are usually at the top.
- [Google Scholar](#) can help you find all papers written by the author, by putting their name in quotes when you search. If you have trouble finding them, you may need to try variations on their name, or just their last name.

Once you find a list of your researcher's papers, you will need to choose one on your topic that interests you. Most researchers study more than one topic, so be sure to choose a paper that pertains to the topic you have chosen. Note that the UofT researcher just needs to be one of the authors on the paper. They may have co-authors.

- **Important note:** For the purposes of this assignment, you need to choose an article written about a **scientific study** or a set of studies. *Meta-analyses* (papers that combine and analyze data from many other papers) and *review articles* (papers that discuss the results of many other papers) are not appropriate for this project. It may take you a few tries before you find a paper that will work for this assignment.

If you have trouble finding a suitable research article, you might consider contacting the UofT Library for assistance, using their [live chat function](#).

You will then need to read the article you have chosen in order to complete the rest of your paper. Sometimes you can access the article's .pdf file directly from Google Scholar or the author's website, but most of the time you will need to use the [UofT Library](#) to get access. Simply copy and paste the title of the article into the Library's search bar, and you will be provided with options for finding the article online. If you're off campus, you may need to sign in with your UTORid to access these features.

In your paper, summarize the article in your own words, covering:

- The study's research question.
- Hypotheses or predictions.
- Population studied.
- Methods used.
- Main results.

This section should be **50-60% of your paper**.

Step E: Extending the Research

Propose a way to build on the study using an emerging technology (e.g., AI, VR, wearable devices). Address:

- What new questions remain?
- How could this technology be used to explore them?

This section should be **20-25% of your paper**.

Format & Citations

- **Length:** 900-1200 words, including in-text citations and references.
- **Citations:** At least one scholarly (primary) source plus the textbook.

- [APA \(7th Ed.\) format](#) required for in-text citations and reference list.
- **Non-scholarly sources (blogs, news, social media, government websites, etc.) do not count** toward the scholarly source requirement, but you may use them if you wish.
- Word count deviations will affect your grade (see rubric on Quercus).
