

Information Presentation Response

The presentation Fake News Solutions effectively addresses the given prompt by covering key strategies such as platform policies, AI-driven detection, and fact-checking partnerships. It accurately fulfills the information need by presenting well-supported solutions, though a deeper discussion of enforcement challenges could enhance it. Overall, it aligns with the prompt's requirements

Cultural Issues in Computer Science Education

Nicki Washington's article, *When Twice as Good Isn't Enough: The Case for Cultural Competence in Computing*, highlights the critical role of cultural competence in computer science education. She argues that computing departments should actively integrate cultural awareness into their curricula. This approach would help address bias, increase diversity, and foster a more inclusive industry (Washington, 2020). Research supports this idea. Studies show that diversity in computing not only improves workplace dynamics but also enhances problem-solving and innovation (Williams et al., 2022). Given the increasing globalization of the tech industry, students must develop cultural competence. This skill will help them navigate diverse professional environments effectively.

From a personal perspective, UTSC promotes diversity in its student body. However, the computer science curriculum still primarily focuses on technical skills. It does not explicitly address cultural awareness. This lack of emphasis can contribute to the persistence of bias in technology, such as algorithmic discrimination in AI systems (Mehrabi et al., 2021). Studies have demonstrated that facial recognition software often misidentifies individuals from underrepresented groups. This issue occurs due to biased training data (Raji & Buolamwini, 2019). If cultural competence were integrated into UTSC's curriculum, students would gain a better understanding of these biases. They would also learn how to develop more equitable computing solutions.

Additionally, cultural competence training has been linked to improved collaboration and workplace performance in technology fields (Patel et al., 2018). Many leading tech companies have recognized this benefit. As a result, they have implemented diversity and inclusion training programs. These companies also acknowledge that teams with varied perspectives create more robust and ethical products (Smith et al., 2021). By adopting Washington's recommendations, UTSC could better prepare its students. They would not only excel technically but also become ethical and socially responsible computing professionals.

In conclusion, Washington's argument for cultural competence in computer science education is well-founded and relevant. UTSC should consider implementing these practices to prepare students for the realities of a diverse industry. Integrating cultural awareness into the curriculum would help future software engineers. It would ensure they are equipped to design fairer and more inclusive technologies.

Criticize an argument (For P3c Right to Be Forgotten)

The Right to Be Forgotten (RTBF) presentation presents a compelling case for allowing

individuals to remove personal information from search engines. It highlights the 2014 Google Spain SL v. Agencia Española de Protección de Datos case as a landmark ruling that established this right within the European Union. While the argument for RTBF is rooted in the protection of individual privacy, it fails to sufficiently consider its implications for free speech, historical accuracy, and technological feasibility. The concept of RTBF raises critical ethical and legal dilemmas, particularly when powerful individuals or organizations seek to remove unfavorable content under the guise of privacy rights (Rosen, 2019).

One of the most significant concerns surrounding RTBF is its potential for censorship. The presentation acknowledges that RTBF could be misused by public figures or corporations to remove damaging yet factual information. For example, the case of pianist Dejan Lazic, who attempted to erase a negative performance review from search results, demonstrates how this right can be exploited to suppress legitimate criticism rather than protect privacy (WQXR, n.d.). Similarly, the Wikipedia case involving Wolfgang Werlé and Manfred Lauber, two German criminals who sought to erase their names from historical records, raises questions about whether such individuals should be able to alter the public record (Schwartz, 2009). While the presentation recognizes these concerns, it does not propose a clear distinction between legitimate privacy protections and unjustified censorship.

In addition to ethical concerns, RTBF also presents significant technical challenges that the presentation does not fully address. Even if information is deleted from search engine results, it may still exist in online archives, news reports, or social media, making complete erasure nearly impossible (Zhang, 2024). Moreover, once information spreads across multiple platforms, it can be copied and redistributed beyond the control of the original publisher. The Streisand effect, which the presentation briefly mentions, illustrates how attempting to remove information can sometimes lead to even greater public attention (Byrne, n.d.). This raises doubts about the effectiveness of RTBF as a solution for protecting privacy in the digital age.

Another flaw in the RTBF argument is the difficulty of balancing personal privacy with the public's right to access information. While the GDPR defines specific conditions under which data should be removed, there remains significant ambiguity about how these decisions should be made (GDPR.eu, 2023). Journalists, historians, and legal scholars argue that allowing individuals to erase records of past actions, particularly in cases involving public figures or criminal activity, undermines transparency and accountability (Pressly, n.d.). If an individual's actions have had a lasting impact on society, does the public not have the right to know? The presentation does not offer a strong framework for determining when privacy should take precedence over public interest, leaving a critical gap in its argument.

Ultimately, while the RTBF presentation effectively outlines the legal and procedural aspects of data removal, it does not fully consider the broader implications of such policies. Privacy is undoubtedly important, but the unrestricted application of RTBF poses significant risks to free expression and historical accuracy. Instead of focusing solely on the removal of information, a more balanced approach might involve labeling outdated or misleading content while preserving public access to critical records. By addressing these concerns, policymakers can create a more effective system that protects both privacy and the integrity of the digital information landscape.
