

STAA57-Winter 2024: Worksheet-1

Shahriar Shams

26 Jan 2024

Questions:

1. Download the “Daily Shelter Overnight Occupancy” data from the city of Toronto’s open data portal (for year 2022). This following line will do that for you

<https://ckan0.cf.opendata.inter.prod-toronto.ca/dataset/21c83b32-d5a8-4106-a54f-010dbe49f6f2/resource/55d58477-50f5-490c-8da8-5953e3b26ca4/download/daily-shelter-overnight-service-occupancy-capacity-2022.csv>

2. Load the dataset in R studio.
3. Create a new dataset (let’s call it ‘new_data’) by filtering only those observations for which PROGRAM_AREA is “Temporary Refugee Response” and SECTOR is “Families”.
4. From the new_data set, select the variable LOCATION_CITY, CAPACITY_ACTUAL_ROOM, OCCUPIED_ROOMS, UNOCCUPIED_ROOMS.
5. Create a summary of the numeric variables in your data.
6. Calculate the total number of UNOCCUPIED_ROOMS for each LOCATION_CITY (print it as a table)
7. In theory, OCCUPIED_ROOMS is the difference between CAPACITY_ACTUAL_ROOM and UNOCCUPIED_ROOMS. Check if this is true for all the observations in your data.

Instructions for completing this worksheet:

- Create a R markdown file, use your name and student id as the author name.
- load the dataset using the following line

```
d = read.csv(file= " ")
```

copy the file location from the top of page and paste it inside the " ".

- Write the rest of the code inside your R markdown file. Make sure to print the output.
- Save your output as a pdf and upload it to crowdmark.
